

Hi kadhim mohsin

# Accessory visual structures

#### **Eyebrow**

 The eyebrow is an area of thick, short hairs above the eye. The <u>main function</u> is to prevent sweat, water, and other debris falling into the eye, but they are also important to human communication and facial expressions.

## **Eyebrow**

#### **Eyelid**

 An eyelid is a thin fold of skin that covers and protects the eye. The levator palpebrae superioris muscle helps in the movement of eyelid. The human eyelid features a row of eyelashes along the eyelid margin, which helps in protection of the eye from dust and foreign debris. The main function of eyelid is to keep the cornea moist and clean.

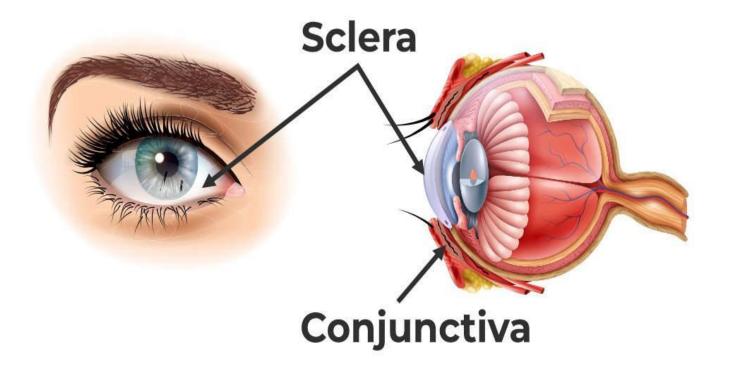

## **Eyelid**

#### Conjunctiva

 The conjunctiva is a tissue that lines the inside of the eyelids and covers the sclera. It is composed of unkeratinized, stratified squamous epithelium with goblet cells, and stratified columnar epithelium. The conjunctiva is basically transparent, and the white colour we see is actually sclera.

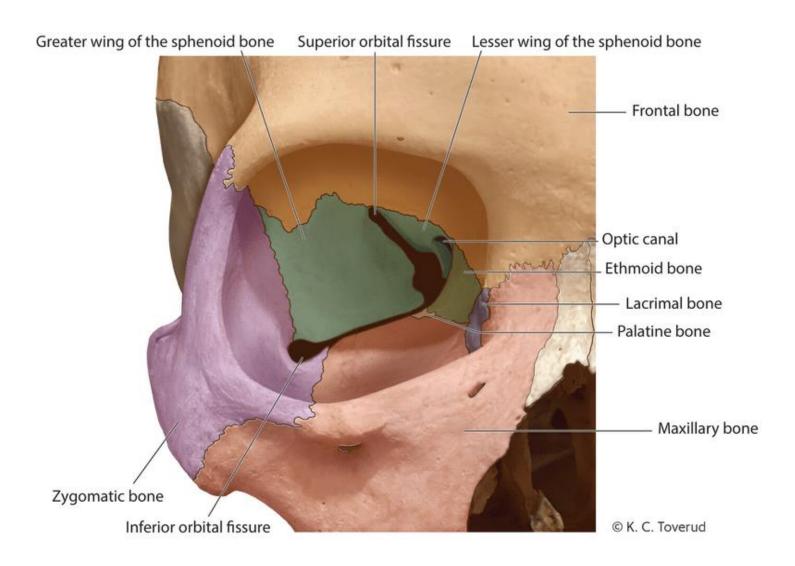

#### Conjunctiva

#### The orbit

The orbit is the cavity or socket of the skull in which the eye and its appendages are situated. In the adult human, the volume of the orbit is \(\tau\cdot\) millilitres (\(\ldot\). \(\ldot\) imp fl oz; \(\ldot\). \(\ldot\) US fl oz), of which the eye occupies \(\ldot\). \(\ldot\) ml (\(\ldot\). \(\tau\) imp fl oz; \(\ldot\). \(\tau\) US fl oz). The orbit helps in smooth rotation of the eyeball

#### The orbit

Hi kadhim mohsin

### Vitreous humour

#### **Learning Objectives**

Understand the composition and function of the vitreous

gel.
